

METHOD AND SYSTEM FOR PROVIDING A MOBILE NETWORK  
NOTIFICATION SERVICE

ABSTRACT

[0046] A method for providing a mobile network notification service including receiving a first telephone number associated with a first notification service customer. The method further includes receiving an indication that a first telephone corresponding to the first telephone number has been powered on and is available in a mobile network. A mobile network status of a second telephone corresponding to a second telephone number is determined in response to locating the second telephone number in a notification list associated with the first notification service customer. The status is transmitted to the first notification service customer.
